MOST EXPERIENCED SUPPLIER OF
MEMBRANE BIOGAS UPGRADING SYSTEMS
Proven membrane technology achieving more than 97% operational availability. System is easily integrated with a biogas plant, provides optimal gas cleaning, a robust design, an advanced patented control system and the assurance of 24/7 service support.

Having constructed the world’s first commercial plant for upgrading biogas using a 3-stage membrane system, Bright Biomethane successfully uses this proven design in its systems operating today.

The advanced design and patented control system makes it possible to inject specification compliant biomethane to grid within a few minutes of start-up. Another option is to use the gas as transport fuel (CNG). Other technologies can take much longer to start up with resultant methane losses and operational inconvenience. Bright Biomethane plant operators have the option to stop and start the facility at their convenience with minimal methane loss and no wasted energy consumption.

99.5% methane recovery, more than any other system. The lowest electricity consumption (0.22 kWh/Nm³ biogas). No heat required for the biogas upgrading process. Heat recovery (> 0.25 kWt/Nm³ biogas) covering the main energy consumption of the biogas facility. Competitive price level.

A Bright Biomethane CO₂ recovery unit can also be integrated with the standard 3 or 2 stage membrane upgrading systems. The high separation efficiency of the membranes means that the energy consumption of CO₂ liquefaction is much lower than conventional systems.

No water or chemicals are needed in the Bright Biomethane process which means that there are no disposal problems, such as acid water or chemicals that can be an unforeseen cost with other technologies.

Bright Biomethane is experienced in managing biogas produced from most forms of biomass feedstock, including municipal sludges and wastes. Based on this experience, reliable biogas pre-treatment solutions can be offered to ensure the correct biogas specification is achieved before upgrading.

In the membrane unit, the gas is separated by means of an imposed pressure difference over the membrane. Two gas streams will be obtained from the plant; a product gas, with a high methane value, and a CO₂-rich gas. As a result of highly selective membranes and the recuperation of methane, the highest possible methane yield can be achieved. Depending on the application, the gas can be upgraded to the preferred methane value.

One of the applications is to inject the obtained gas into the national gas grid. It can also be used as transportation fuel (CNG/LNG) for vehicles. In both applications the patented 3 stage separation process ensures that the gas meets the requirements for a specific application. The residual heat and the CO₂ can also be utilised. A special heat recovery system can be installed to produce high temperature water and CO₂ may be recovered and liquefied to provide an additional value stream.
BRIGHT SOLUTIONS

Bright Biomethane is the largest supplier and most experienced supplier of well-proven biogas upgrading systems. Our systems are available from 40 Nm³/hr to 5,000 Nm³/hr (and higher).

By applying highly efficient membranes the separation of methane from biogas can reach an efficiency of more than 99.5% and render biomethane suitable for injection in the national grid or compression to CNG or LNG which can be used as vehicle fuel.

In addition to the production of biomethane the Bright Biomethane systems may be used to recover and liquefy CO₂ to create an extra source of revenue for the plant owner.
